APPENDIX A: ONLINE APPENDIX: ADDITIONAL INFORMATION ON THE SURVEY AND THE CONTEXT

A.1 Institutional Context for Campus Recruitment

In most elite institutions in India, “campus recruitment” is a common practice. Representatives of recruiting firms—current employees including managers and at times vice-presidents—travel to university campuses and interview final-year students during pre-scheduled sessions. The recruitment process usually involves several stages: written aptitude tests, followed by one or more rounds of interviews. The final stages of the interview process, aside from the HR round, are often conducted by a panel that includes the hiring manager(s) under whom the selected candidate would work. This institutional feature typically makes jobseekers aware of the gender of their potential manager before accepting a job offer.

A.2 Details on Survey Administration and Data Collection

The online survey was designed and implemented on Qualtrics. We collected data in the second week of April 2020, using an online survey administered to students of a highly selective public university in India. Access to the internet was not a concern for our sample of students studying in a premier university in one of the largest metropolitan cities of India. However, we paid special attention in designing the survey to ensuring that it was mobile-friendly, in consideration of the fact that a small but significant proportion of the target population might not have access to a computer. Recruitment of students was done by the research assistants (RAs), who had previous experience in recruiting students for surveys and RCTs. We administered the online survey in three key steps.

Step 1: The RAs, based on their previous experience, sent a sign-up link to each department’s student class representative, who distributed the link in the class lists. The

sign-up sheet, in addition to containing the consent form for them to sign, asked for e-mail addresses to which the link of the survey would be sent, as well as basic demographic information, department affiliation, faculty of study (arts/science/engineering) and level (bachelor's or master's) and year of study. The sign-up sheet described the survey as "*...an online survey on hypothetical job choices*" with the purpose described as "*...to better understand the preferences for the different attributes of jobs.*". Students were also allowed to choose the date and the time at which they would like to take the survey. They had a choice among 5 dates from April 7th to April 11th. On their selected date, they had a choice among 6 time slots: 10 am, 12 noon, 5 pm, 7 pm, 9 pm and 11 pm. We observed that our pilots that had specified time slots along with dates had higher completion rates than those with just dates. The sign-up form ended with a summary. The sign-up form was designed to automatically send respondents' enrollment form to their email address. This enabled us to automatically have the signed copy of the consent form sent to the participant.

Step 2: Upon receiving the sign-ups, we scheduled emails to be sent out with unique links to the survey for each participant an hour before each he or she was scheduled to participate in the survey. Hence, the link could not be used on two different devices to fill in the survey. The survey was also designed to prevent ballot-boxing; i.e., once the survey was completed from one link, when clicked again, that link would show a confirmation that the survey had already been completed. The links were designed to expire within 24 hours. Thanks to the extensive pilots done before, we did not face any technical difficulties while implementing the survey. Debriefs with pilot participants were extremely helpful for rewording the questions to optimize communication and maximize participants' understanding.

Step 3: The mode and details of online payment were selected in the last section of the survey. The options included direct bank transfers, PayPal and UPI (unified payment interface). The payment was processed for the list of verified students within the prestated timeline for each payment mode.

After respondents completed and submitted the survey, payment-handle information (bank-transfer details, PayPal email, or UPI identifier, as selected by the respondent) was collected separately, outside the survey instrument. As a consequence, no payment-handle fields are present in the survey data by construction. The payment-handle records were used solely to remit the INR 500 payment and were subsequently destroyed; they are not retained by the authors and are not included in this replication package or in any separate confidential bundle. No analysis in the paper uses these fields.

APPENDIX B: ONLINE APPENDIX: NON-PARAMETRIC EMPIRICAL BAYES (NPEB)
SHRINKAGE WITH HETEROSKEDASTIC ERRORS

B.1 Setup

For each individual $i = 1, \dots, n$ we observe an estimate $\hat{\theta}_i$ together with its standard error s_i that we obtain by estimating the model separately for each individual. We model:

$$\hat{\theta}_i = \theta_i + \varepsilon_i, \quad \varepsilon_i | s_i \sim \mathcal{N}(0, s_i^2)$$

Equivalently,

$$\hat{\theta}_i | \theta_i, s_i \sim \mathcal{N}(\theta_i, s_i^2)$$

where $\hat{\theta}_i$ is the noisy point estimate, θ_i is the latent effect, and s_i is the known individual-specific standard error. θ_i are i.i.d. draws from an unknown population distribution $G()$ with density $g()$. The conditional density of the observed estimate is

$$f_i(\hat{\theta}_i | \theta_i, s_i) = \frac{1}{s_i} \phi\left(\frac{\hat{\theta}_i - \theta_i}{s_i}\right)$$

where $\phi(\cdot)$ denotes the standard normal pdf. Integrating out θ_i gives us the marginal density of $\hat{\theta}_i$

$$f_i(\hat{\theta}_i) = \int_{\mathbb{R}} \frac{1}{s_i} \phi\left(\frac{\hat{\theta}_i - \theta}{s_i}\right) g(\theta) d\theta \quad (1)$$

B.2 Log-spline deconvolution estimator for $G()$

We approximate the integral in (1) on a grid of M support points $\tau_1 < \dots < \tau_M$ with width $\Delta = \tau_{m+1} - \tau_m$ as

$$f_i(\hat{\theta}_i) \approx \sum_{m=1}^M K_{im} g_\alpha(\tau_m), \quad \text{where } K_{im} := \frac{1}{s_i} \phi\left(\frac{\hat{\theta}_i - \tau_m}{s_i}\right) \Delta$$

where α is a vector of parameters that we use to model the density $g()$ on the grid, $g_m()$ is the density at node m , and K_{im} is the likelihood contribution of node m to the observed estimate $\hat{\theta}_i$. The likelihood contribution of each node is scaled by the width Δ to ensure that the sum approximates the integral.

We approximate $G()$ in smooth exponential family with log density parameterized by log-splines (Efron 2016). Let Q be the $M \times J$ design matrix of cubic B-spline basis functions $B_j(\tau)$ evaluated on the grid. Give α , the mass at point m is given by

$$g_\alpha(\tau_m) := \exp\left((Q\alpha)_m - \log \sum_{m=1}^M \exp((Q\alpha)_m)\right),$$

where $(Q\alpha)_m = \sum_{j=1}^J \alpha_j B_j(\tau_m)$ and α is the parameter vector parametrizing the cubic splines $B_j(\tau)$, $j = 1, \dots, J$. Denoting $g_\alpha \equiv (g_\alpha(\tau_1), \dots, g_\alpha(\tau_M))'$ and $K_i \equiv (K_{i1}, \dots, K_{iM})'$,

define the mixture vector $f_i(\alpha) := K_i' g_\alpha$, which is the marginal likelihood of $\hat{\theta}_i$ under the log-spline model with parameters α . The parameters α governing $g(\cdot)$ are estimated by a penalised log-likelihood:

$$\hat{\alpha} = \arg \max_{\alpha} \sum_{i=1}^N \log(f_i(\alpha)) - \lambda \sqrt{\alpha' \alpha}, \quad (2)$$

where the ridge penalty $\lambda \geq 0$ is a tuning parameter. The objective function is numerically optimized using the Broyden-Fletcher-Goldfarb-Shanno (BFGS) algorithm to obtain $\hat{\alpha}$. The corresponding log-spline deconvolution estimate of $G(\cdot)$ is :

$$\hat{G}(\theta) = \sum_{m=1}^M \mathbb{I}\{\tau_m \leq \theta\} g_{\hat{\alpha}}(\tau_m)$$

B.3 Posterior mean and shrinkage factor

Given $\hat{\alpha}$, the posterior density for individual i at τ_m on the grid is obtained via Bayes' rule:

$$p_{im} = \frac{K_{im} g_{\hat{\alpha}}(\tau_m)}{f_i(\hat{\alpha})} = \frac{K_{im} g_{\hat{\alpha}}(\tau_m)}{\sum_{j=1}^M K_{ij} g_{\hat{\alpha}}(\tau_j)}$$

This leads to individual i 's posterior means $\hat{\theta}_i^{NPEB}$:

$$\hat{\theta}_i^{NPEB} = E[\theta | \hat{\theta}_i] = \sum_{m=1}^M p_{im} \tau_m \quad (3)$$

and the individual i 's shrinkage: $\hat{\theta}_i^{NPEB} - \hat{\theta}_i = \sum_{m=1}^M p_{im} (\tau_m - \hat{\theta}_i)$.

APPENDIX C: ONLINE APPENDIX: SURVEY QUESTIONS

APPENDIX: INTRODUCTION

Thank you for participating in a survey on preferences for job character

The session will be in three parts :

1. Practice questions for demonstration purposes
2. The actual Survey
3. Basic demographic questions

This is a completely anonymous survey and we will not be recording your name or any other personal information.

PLEASE ANSWER OPENLY AND HONESTLY.

Please respond to this survey on a computer or a laptop.

There is no BACK button on this survey to go back to previous page.

If at any point during the survey you are confused about anything, please ask the person in-charge.

INSTRUCTIONS

In each question you will see a choice scenario.

A scenario will have 3 jobs (X, Y and Z), which you have to assume have been offered to you.

Each job will have 4 characteristics:

Manager: First name of the team's manager.

Annual wages: Gross annual salary (in lakhs).

Flexible hours: Whether the job allows for flexible hours or not.

Manager rating: This is the average rating of the mentorship of the m provided by this manager's current employees in an anonymous survey.

This is a measure of how good of a mentor this manager is to its subordi

This rating is on a scale of 1-5. The scale points mean as follows:

1: Poor; 2: Fair; 3: Good; 4: Very good; 5: Excellent.

There will be 20 such choice scenarios.

APPENDIX: INSTRUCTIONS

In each scenario we will first ask you:

A. To choose one job among 3 job options.

Your instructions are:

To assume that all other characteristics, which are NOT MENTIONED here, are THE SAME in all the jobs. For example work from home under each manager is not shown here. You are to assume that it is either

available or not available in all three jobs. No job is different in anything that you do not observe,

In each scenario, we will then ask you for:

B. If you were to negotiate wages, how much **minimum increase in wages** you would need in each of the other two jobs, for you to choose them instead.

Your instructions are:

State your wage increase, assuming that it does not change anything else about the job.

Let us give you an example from a survey of food preference.

- A. Here you will see me choose one dish among 3 different dishes.
- B. Then you will see me state how much **MINIMUM** drop in prices in the other two dishes would make me choose each of them instead. I ranked this scenario among dishes in the following way, given my preferences on these characteristics:

Dish characteristics	Dish X	Dish Y	Dish Z
Cuisine	Nepalese	Thai	Argentinian
Price	500	480	540
Vegetarian	Yes	No	No
Spice level	6.7/10	4.7/10	6.9/10

Choice:

Dish X

 Dish Y Dish Z

I chose Dish X.

Observe how I followed all instructions:

1. I have to assume that the dishes are only different in cuisine, price, vegetarian and spice level and in no other characteristics. For example, if I am wondering whether it will be a dry dish or a gravy dish, as per instructions, I will assume that they are the same in all three dishes. Since I like dry dishes, I will assume all three are dry dishes.

Next I was asked how much minimum drop in prices would I need in my unselected choices (Dish Y and Dish Z) for me to choose them instead.

Dish characteristics	Dish X	Dish Y	Dish Z
Cuisine	Nepalese	Thai	Argentinian
Price	500	480	540
Vegetarian	Yes	No	No
Spice level	6.7/10	4.7/10	6.9/10

Given my preferences and the extent to which I like/dislike the characteristics of the dishes, I reported that:

The price of Dish Y needs to drop by at least 35 rupees for me to choose Dish Y.
The price of Dish Z needs to drop by at least 20 rupees for me to choose Dish Z.

TABLE 1. Incomplete Scenario 1

Job choice

Rating of each manager could be different, but the data is unavailable. Anything else that you do not see here is the SAME across all jobs. Please select your most preferred job.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	6	6.6	6.4
Flexible hours	yes	no	yes
Manager	Anirban	Shrinita	Arup
Manager rating	N/A	N/A	N/A

Job X

Job Y

Job Z

Compensating differential (if Job Y was chosen)

You chose Job Y.
If you were to negotiate your wage, how much of a MINIMUM INCREASE IN WAGES would you need in each of the other jobs for you to choose it instead of Job Y?
The scale here ranges from 0 to 2 lakhs.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	6	6.6	6.4
Flexible hours	yes	no	yes
Manager	Anirban	Shrinita	Arup
Manager rating	N/A	N/A	N/A

Display logic: If the respondent set any compensating-differential slider shown above to the 2-lakh maximum, the survey displayed the following follow-up separately for each job whose slider hit that maximum. Example for Job Y:

Your preferred wage increase in at least one of the jobs hit the maximum limit. How much MORE wage increase (in lakhs) do you need? ____ Job Y

TABLE 2. *

Notes for the reader: Manager-gender assignment: Job X male, Job Y female, Job Z male.

TABLE 3. Incomplete Scenario 2

Job choice

Rating of each manager could be different, but the data is unavailable. Anything else that you do not see here is the SAME across all jobs. Please select your most preferred job.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	8.9	8.2	8.1
Flexible hours	no	yes	yes
Manager	Ishita	Isha	Inder
Manager rating	N/A	N/A	N/A

Job X

Job Y

Job Z

Compensating differential (if Job Z was chosen)

You chose Job Z.
If you were to negotiate your wage, how much of a MINIMUM INCREASE IN WAGES would you need in each of the other jobs for you to choose it instead of Job Z?
The scale here ranges from 0 to 2 lakhs.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	8.9	8.2	8.1
Flexible hours	no	yes	yes
Manager	Ishita	Isha	Inder
Manager rating	N/A	N/A	N/A

Display logic: If the respondent set any compensating-differential slider shown above to the 2-lakh maximum, the survey displayed the following follow-up separately for each job whose slider hit that maximum. Example for Job Y:

Your preferred wage increase in at least one of the jobs hit the maximum limit. How much MORE wage increase (in lakhs) do you need? ____ Job Y

TABLE 4. *

Notes for the reader: Manager-gender assignment: Job X female, Job Y female, Job Z male.

TABLE 5. Incomplete Scenario 3

Job choice

Rating of each manager could be different, but the data is unavailable. Anything else that you do not see here is the SAME across all jobs. Please select your most preferred job.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	5.9	6.9	6.2
Flexible hours	yes	no	yes
Manager	Prantik	Partha	Piyali
Manager rating	N/A	N/A	N/A

- Job X
- Job Y
- Job Z

Compensating differential (if Job Y was chosen)

You chose Job Y.
If you were to negotiate your wage, how much of a MINIMUM INCREASE IN WAGES would you need in each of the other jobs for you to choose it instead of Job Y?
The scale here ranges from 0 to 2 lakhs.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	5.9	6.9	6.2
Flexible hours	yes	no	yes
Manager	Prantik	Partha	Piyali
Manager rating	N/A	N/A	N/A

Display logic: If the respondent set any compensating-differential slider shown above to the 2-lakh maximum, the survey displayed the following follow-up separately for each job whose slider hit that maximum. Example for Job Y:
Your preferred wage increase in at least one of the jobs hit the maximum limit. How much MORE wage increase (in lakhs) do you need? ____ Job Y

- Job X
- Job Y
- Job Z

Compensating differential (if Job Y was chosen)

You chose Job Y.

If you were to negotiate your wage, how much of a MINIMUM INCREASE IN WAGES would you need in each of the other jobs for you to choose it instead of Job Y?

The scale here ranges from 0 to 2 lakhs.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	9.2	9.5	9
Flexible hours	yes	no	yes
Manager	Damini	Deepa	Dharmesh
Manager rating	3.65	3.00	3.10

Display logic: If the respondent set any compensating-differential slider shown above to the 2-lakh maximum, the survey displayed the following follow-up separately for each job whose slider hit that maximum. Example for Job Y:

Your preferred wage increase in at least one of the jobs hit the maximum limit. How much MORE wage increase (in lakhs) do you need? ____ Job Y

TABLE 26. *

Notes for the reader: Manager-gender assignment: Job X female, Job Y female, Job Z male.

TABLE 27. Complete Scenario 4

Job choice

Anything else that you do not see here is the SAME across

all jobs. Manager rating is on a scale of 1-5. 1: Poor;

2: Fair; 3: Good; 4: Very good; 5: Excellent. Please

select your most preferred job.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	4.1	4.5	5
Flexible hours	yes	no	no
Manager	Abhimanyu	Arkajeet	Ananya
Manager rating	3.25	4.25	3.75

Job X

Job Y

Job Z

Compensating differential (*if Job Z was chosen*)

You chose Job Z.

If you were to negotiate your wage, how much of a MINIMUM INCREASE IN WAGES would you need in each of the other jobs for you to choose it instead of Job Z?

The scale here ranges from 0 to 2 lakhs.

Attributes	JOB X	JOB Y	JOB Z
Annual Wages	4.1	4.5	5
Flexible hours	yes	no	no
Manager	Abhimanyu	Arkajeet	Ananya
Manager rating	3.25	4.25	3.75

Display logic: If the respondent set any compensating-differential slider shown above to the 2-lakh maximum, the survey displayed the following follow-up separately for each job whose slider hit that maximum. Example for Job Y:

Your preferred wage increase in at least one of the jobs hit the maximum limit. How much MORE wage increase (in lakhs) do you need? ____ Job Y
